PennEast PIPELINE

AUGUST 2016 UPDATE

Project Update for Landowners on the Pipeline Route

PENNEAST TAKES BIG STEP FORWARD WITH FERC ANNOUNCEMENT

We're pleased to announce that on July 22, 2016, the Federal Energy Regulatory Commission (FERC) released its draft environmental impact statement (EIS) for the PennEast Pipeline Project. The draft EIS is another major step forward in the review of the Project and the goal to safely deliver clean, American-made energy.

FERC has concluded, "approval of the Project would result in some adverse environmental impacts; however, most of these impacts would be reduced to less-than-significant levels with the implementation of PennEast's proposed mitigation and the additional recommendations in the draft EIS."

FERC's findings include that the Project could, "contribute to a cumulative improvement in regional air quality if a portion of the natural gas associated with the Project displaces the use of other more polluting fossil fuels." FERC also addresses the need for the Project, stating, "There is no available capacity for existing pipeline systems to transport the required volumes of natural gas to the range of delivery points proposed by PennEast."

The complete draft EIS is available on the "Official Filings" page of the PennEast website, www.penneastpipeline.com.

PennEast looks forward to additional environmental input gained at FERC's six upcoming DEIS public comment meetings, to be held August 15 - 17. Following the DEIS comment period, PennEast will await FERC's Final Environmental Impact Statement in the months ahead, and anticipates FERC's final decision in 2017.

As always, PennEast continues to encourage an open line of communication to address your concerns, as well as to reach amicable entry agreements. Please call PennEast's land team at (855) 303-4830. We look forward to continue working with you and all of the local communities.

Sincerely,

Jeff England, Project Manager

AMERICAN ENERGY SECURITY

Pipelines like PennEast that move American energy reduce our reliance on foreign energy sources.

At their last estimate, the Potential Gas Committee projected the U.S. has 2,515 trillion cubic feet (Tcf) of recoverable natural gas. That's nearly a hundred-year supply.

Leveraging America's abundant natural gas reserves through new pipelines like PennEast enhances national security, benefits consumers and serves as a powerful economic weapon.

WE'RE LISTENING

LAND AGENTS: ADDRESSING LANDOWNER CONCERNS

PennEast is committed to ensuring residents have the opportunity to learn the truth about natural gas pipelines, and specifically PennEast, from PennEast representatives. That's why some of you may have received a note from John Barenz.

John is a senior member of PennEast's Land Team who was profiled in March's newsletter. John has been reaching out to some landowners to fully understand their concerns and see how they might be addressed.

That's the role of land agents – to serve as a liaison between the landowner and PennEast. That's also why PennEast has been seeking survey permission to discover "proprietary information." This information is simply property features, like wells or septic systems, that could affect construction of the Pipeline. It's the agent's duty to learn as much as possible about each parcel of the PennEast route to avoid sensitive areas. As PennEast moves into the second half of 2016, making modifications to the Pipeline route becomes less feasible.

LANDOWNER COMMITMENT

RESPECTING THE RIGHTS OF EVERY LANDOWNER

PennEast has worked tirelessly to engage in a respectful dialogue with landowners that has, in many instances, resulted in modifications to the route and reduced landowner impacts.

PennEast's efforts to work collaboratively with landowners were affirmed on July 7 when a New Jersey State Superior Court judge rejected a lawsuit by a group of New Jersey residents alleging trespassing by PennEast. These individuals were trying to stop PennEast from taking project-related surveys, and thereby disrupt the thorough environmental review process that has been underway for nearly two years.

With the judge's dismissal of the residents' claims, PennEast will resume and complete Project surveys where there is landowner permission. PennEast will continue working toward Project approval to deliver lower cost energy and thousands of jobs that together will power the region's future.

CLEANER AIR

NATURAL GAS: POWERING OUR ECONOMY, IMPROVING AIR QUALITY

Compared to fuels such as coal and oil, the increased use of natural gas is reducing emissions of pollutants such as mercury, particulate matter, sulfur dioxide, and nitrogen oxides.

The growing role of natural gas in the electric power sector has resulted in America's greenhouse gas emissions falling to levels not seen since 1994. In fact, U.S. energy-related carbon dioxide emissions (CO_2) have declined in five of the past eight years. So as natural gas displaces coal and oil to generate U.S. electricity, air quality will continue to improve.

This year, for the first time ever, natural gas-fired electric generation is projected to exceed coal generation on an annual basis.

As the trend towards greater natural gas use across our economy continues – especially in the power sector – new natural gas infrastructure like the PennEast Pipeline is critical.
